SYSTEMATIC REVIEWS AND META-ANALYSIS IN ACTION: A HANDS-ON WORKSHOP

In a world where researchers are drowning in information, high-quality evidence summaries that follow a systematic approach to identify, select, appraise, and synthesize the research landscape have become an essential tool for every researcher. Unfortunately, many reviews lack the rigor needed to provide trustworthy evidence and an unbiased picture of the accumulated evidence. Carrying out such research on one's own requires mastery of a number of

methodological and statistical strategies. The purpose of this hands-on workshop is to arm researchers and students with the skills they need to better understand primary studies and the principles of the systematic review methodology—skills that will make it possible to effectively conduct and publish standardized systematic reviews in their topics of research.
